

5(a) Remember: There is only one cake and only one person cuts. There are 3 different opinions about the cake.

How much they value the piece of cake.

Same physical piece of the cake.

A values it at 4 units

B " " " 5 units

C " " " 5 units

A cuts into 3 equal pieces.

Whole Cake: 24 units.

$$\frac{1}{3} \text{ of Cake} = \frac{1}{3} \text{ of } 24 = 8$$

Agatha cuts.

Her view:

$$8 \text{ } \{ \text{ } \} \text{ } 8 \text{ } \{ \text{ } \} \text{ } 8$$

all 3 are acceptable to Agatha.

B's view of cake after Agatha cuts.

$$10 \text{ } \{ \text{ } \} \text{ } 9 \text{ } \{ \text{ } \} \text{ } 5$$

↑ Fair Share "acceptable" "approves"
 ↑ Fair Share
 ↑ Too Small

C's view of cake after Agatha cuts.

$$8 \text{ } \{ \text{ } \} \text{ } 6 \text{ } \{ \text{ } \} \text{ } 10$$

↑ Fair
 ↑ Too small
 ↑ Fair

Each wants $(\frac{1}{3} \text{ of } 24) = 8$ or more.

One possible Fair division:

Give lefthand piece to C.

C thinks this is worth 8 — a Fair share/
approves / accepts.

Give middle piece to B.

B thinks this is worth 9 — happy with this.

A gets righthand piece — worth 8 (to A).

See handout on one-divider or
textbook to see how we reached
this allocation.

B envies C.

In B's opinion:

B gets middle piece — worth 9.

C gets lefthand piece — worth 10.

B thinks C is getting more than B.
